

5. The method of claim 3 wherein generating a context value further comprises generating a flat context value that indicates that the device is laying flat and wherein the control step for using a context value to control the operation of one or more aspects of the device further comprises selecting an orientation for an image on the display by finding a tilt context value that was maintained for longer than a set period of time before the flat context value was generated.

6. The method of claim 2 wherein the step for using a context value to control the operation of one or more aspects of the device comprises changing the contrast level on a display based on the tilt context value.

7. The method of claim 2 wherein the step for using a context value to control the operation of one or more aspects of the device comprises scrolling an image on the display based on the tilt context value, the rate of scrolling being based on the difference between a current tilt context value and an initial tilt context value that was determined when scrolling was initiated.

or more aspects of the device comprises preventing the device from entering an idle mode based on the holding context value.

5 12. The method of claim 1 wherein generating one or more context values comprises generating a sequence of proximity context values that indicate the proximity between the device and an object and wherein the control step for using a context value to
10 control the operation of one or more aspects of the device comprises preventing the device from entering an idle mode based on the sequence of proximity context values.

15 13. The method of claim 12 wherein the control step for using a context value to control the operation of one or more aspects of the device comprises allowing the device to enter an idle mode if all of the proximity context values in the
20 sequence of proximity context values are the same.

14. The method of claim 1 wherein generating one or more context values comprises generating a holding context value that indicates that the user is
25 holding the device and at least one orientation context value that indicates that the device is in an orientation consistent with the user wanting to use the device and wherein the control step for using a context value to control the operation of one or more

aspects of the device comprises activating an application based on the holding context value and the orientation context value.

5 15. The method of claim 14 wherein activating an application comprises activating a sound capturing application so that it captures sound.

10 16. A device with a display, the device comprising:

at least one sensor that generates a sensor
signal indicative of the orientation
of the device relative to the earth;
control means for using the sensor signal
15 to control the operation of at least
one aspect of the device.

20 17. The device of claim 16 wherein the at least one sensor comprises a tilt sensor.

18. The device of claim 17 wherein the control means uses the sensor signal from the tilt sensor to scroll an image on the display, the scrolling being controlled in part based on the difference between a
25 current signal from the tilt sensor and a signal from the tilt sensor when tilt scrolling is initiated.

24. The device of claim 17 wherein the control means uses the sensor signal from the tilt sensor to adjust the contrast on the display.

5 25. The device of claim 17 wherein the at least one sensor further comprises a touch sensor.

26. The device of claim 25 wherein the control means uses the sensor signals from the tilt sensor
10 and touch sensor to determine whether to place the device in a full power mode.

27. The device of claim 25 wherein the control means uses the sensor signals from the touch sensor
15 to determine whether to place the device in an idle power mode.

28. The device of claim 25 wherein the control means uses the sensor signals from the tilt sensor
20 and touch sensor to determine whether to activate an application.

29. The device of claim 17 wherein the at least one sensor further comprises a proximity sensor.
25

30. The device of claim 29 wherein the control means uses the sensor signals from the proximity sensor to determine whether to place the device in an idle power mode.
